

Employee Data Analysis Report

Workforce, Salary, Performance and Promotion Overview

This report is based on data collected for 1,474 employees. It includes department, salary, performance rating, attendance, tenure and promotion status for each person. The main goal of this report is to understand how these different aspects of the workforce relate to each other, such as whether higher performance leads to higher pay or promotion, and whether staying longer at the company makes a real difference.

A Quick Note on Data Quality

Before going into the analysis, it is worth mentioning two issues found in the data. First, 43 rows have “Unknown” listed somewhere, spread across Department, Gender, Job Role, Promotion Status and Work Location. Instead of removing these rows from the whole dataset, they were kept and only left out of the specific chart where that column was being used, so the rest of the data for those employees is still counted everywhere else.

Second, a small number of salary values look like data entry mistakes. Three employees show a monthly salary below Rs 5,000, which is too low to be realistic, and nine employees show a salary above Rs 5,00,000, with one entry going as high as Rs 50 lakh. These look like typing or entry errors rather than real salaries. They were left out of the salary charts and average calculations, so they do not distort the numbers, but they were not deleted from the dataset itself. It would help to have these specific entries checked against the original source records to confirm whether they are genuine or need correction.

1. Workforce Overview

The company has employees spread across 10 departments. Sales, Marketing and Operations have the most people, while Customer Support and Administration have the fewest, though the gap between them is not huge. The gender split is close to even, with only a small gap between male and female employees. Most employees fall between 30 and 50 years old, so the workforce is mostly experienced and mid-career rather than very young or very senior.

Figure 1: Number of employees in each department

Insight: Sales, Marketing and Operations have the most employees, while Customer Support has the fewest, though department sizes are close overall.

Figure 2: Gender split

Insight: The gender split is almost equal, with only a small gap between male and female employees.

Figure 3: Age distribution of employees

Insight: Most employees are between 30 and 50 years old, showing an experienced, mid-career workforce.

2. Salary Overview

Once the outlier salary values are set aside, most employees earn somewhere between Rs 90,000 and Rs 2,30,000 a month. Operations and Logistics pay the most on average, followed closely by Sales, Finance, R&D, Administration and IT. Customer Support and HR pay the least. Salary does not move together with performance rating or value score, so pay looks like it depends mainly on department and role rather than how well someone performs.

Figure 4: Monthly salary distribution

Insight: Most salaries are concentrated between Rs 90,000 and Rs 2,30,000, with a few high and low outliers left out to keep the numbers accurate.

Figure 5: Average monthly salary by department

Insight: Operations and Logistics pay the highest on average, while Customer Support and HR pay the lowest, showing pay differences are mostly department based.

3. Performance and Employee Value Rating

Each employee has a performance rating from 1 to 5, an attendance percentage, and a combined employee value score. This score blends performance (50%), attendance (30%) and tenure (20%) into one number. Both the performance ratings and the value groups are spread evenly across the workforce, with no single group standing out much more than the others.

Figure 6: Performance rating distribution

Insight: Ratings from 1 to 5 are spread almost evenly, so there is no strong bias toward high or low performers.

Figure 7: Employee value rating distribution

Insight: Employees are split nearly equally into Low, Medium and High value groups.

4. Tenure and Employee Value

Tenure, meaning how long someone has worked at the company, goes up to about 8.5 years. There is only a weak link between tenure and value score, since employees with short tenure can score just as high as those who have been there for years. This suggests skill and consistency matter more than simply staying longer.

Figure 8: Tenure vs employee value score

Insight: Value score does not rise clearly with tenure, showing longer service alone does not guarantee a higher score.

5. Promotion Analysis

About 1 in 3 employees have been promoted so far. The most notable finding is that promotion rate barely changes across Low, Medium and High value ratings, staying close to 33 to 37 percent in every group. This means a high value score does not clearly lead to a better chance of promotion, and the pattern is similar across departments and gender too.

Figure 9: Promoted vs not promoted employees

Insight: Roughly one third of employees have been promoted, while the rest have not.

Figure 10: Promotion rate by employee value rating

Insight: Promotion rate stays almost the same across all value groups, suggesting promotions are not closely tied to the performance data collected.

6. Key Takeaways

- Sales, Marketing and Operations are the biggest departments, and the gender split is close to even.
- 43 rows have an Unknown value somewhere, and a few salary entries look like data errors that should be checked.
- Operations and Logistics pay the most on average, once the outlier salaries are set aside. Customer Support and Human Resources pay the least.
- Salary does not move together with performance or the employee value score, so pay looks driven mainly by department and role.
- Performance ratings and value ratings are spread evenly, with no group dominating the workforce.
- Tenure has almost no relationship with employee value score, so longer service does not mean a higher score.
- Promotion rate stays around 33 to 37 percent regardless of value rating, department or gender, which suggests promotions are not closely linked to the performance data in this dataset.
